

Chibueze Aniezeofor

Backend Engineer · Node.js · TypeScript · AI Systems

📍 Nigeria (Remote) | 🌐 codad5.me | ✉ aniezeoformic@gmail.com | 🔗 linkedin.com/in/chibueze-michael | github.com/codad5

Summary

Backend engineer with 5+ years building scalable APIs, AI-powered platforms, and production infrastructure. Known for taking products from zero to scale — architected the backend for AwaDoc from the ground up to 100,000+ users, processing 240k+ daily messages with live payment flows. Also builds deep systems-level projects from scratch: designed a custom binary tunneling protocol over TLS, multi-tenant RBAC architecture, and automated ACME certificate infrastructure for raba, an open-source ngrok alternative in Rust. Comfortable owning complex backend systems end-to-end, from system design to production deployment. Background in Mechanical Engineering sharpens how I approach systems thinking and performance under constraints.

Technical Skills

Languages	TypeScript, JavaScript, PHP, Rust, Python
Backend & APIs	Node.js, NestJS, Express.js, Laravel, FastAPI
Databases	PostgreSQL, MySQL, MongoDB, Redis
AI & LLMs	OpenAI API, DeepSeek, Qdrant (vector search), prompt engineering
Infrastructure	Docker, GitHub Actions, Prometheus, Grafana, Loki, Linux server admin
Queues & Messaging	BullMQ, RabbitMQ, Celery, WhatsApp Business API
Frontend	React, Next.js, Vue 3, Inertia.js, Tailwind CSS
Other	WebSockets, REST APIs, OAuth 2.0, CLI development, SQLAlchemy

Experience

Founding Engineer — AwaDoc (AI Health Startup, Nigeria)

January 2024 – Present

AwaDoc is an AI-driven health assistant that gives Nigerians access to reliable medical guidance via WhatsApp.

- Architected the full backend from scratch — API layer, WhatsApp bot infrastructure, Admin web app, and payment systems — scaling to **100,000+ active users** across multiple Nigerian states.
- Engineered a message processing pipeline handling **240,000+ daily messages**, with ~30% converting to paid transactions.
- Engineered a high-throughput queue system capable of sustaining **10,000+ messages per hour** with consistent reliability under load.
- Integrated OpenAI and DeepSeek for natural language processing; led prompt optimization work that reduced AI hallucinations by **40%**.

- Led security hardening after an early breach: enforced Redis auth, Docker network isolation, SSL termination, and access controls.
 - Stack: Node.js, NestJS, Express, MongoDB, Redis, BullMQ, Docker, Qdrant, OpenAI, WhatsApp Business API.
-

Contract WordPress Plugin Developer — Fusion Intelligence (*Nigeria*)

December 2024 – Present

- Developed custom WordPress themes and plugins that improved product delivery speed and reliability for the company's client base.
 - Maintained **99.9% uptime** across deployed plugins; optimized workflow efficiency by 40% and increased user engagement by 50% through responsive design improvements.
-

PHP Developer — Cyberinfomatic (*Nigeria*)

March 2024 – December 2024

- Shipped a real-time crypto price tracking plugin for WordPress using PHP.
 - Developed a Laravel-based License Management System, cutting validation time by **60%** via Redis caching.
 - Secured WordPress.org plugin approval within 2 weeks of submission; boosted overall plugin performance by 70%.
-

Backend Developer — Appsthathelps (*Mobile App Agency*)

July 2023 – August 2024

- Designed and maintained Laravel APIs powering a mobile app with **5,000+ downloads**.
 - Integrated OneSignal push notifications; sustained 99.9% API uptime across production.
 - Automated recurring data updates via PHP cron jobs, reducing manual engineering work by 90%.
-

Backend Developer — Clusterlearn (*Learning Platform*)

January 2023 – June 2023

- Implemented a Node.js learner-matching system that improved platform retention by 40%.
 - Integrated Google Calendar API to streamline scheduling, improving efficiency by 50%.
 - Strengthened authentication security with Redis-based email validation mechanisms.
-

Freelance PHP & Web Developer (*Upwork*)

2020 – Present

- Delivered 10+ production websites and 5+ open-source contributions across industries; 90% client satisfaction rating.
 - Delivered custom PHP plugins, scrapers, and dashboards for startups and NGOs.
-

Projects

raba — Self-Hosted Tunneling Platform (*Open Source, ngrok alternative*)

Rust · TypeScript/React · Docker · GitHub Actions · github.com/codad5/raba

- Designed and implemented a custom multiplexed binary protocol over TLS from scratch — tunneling HTTP, TCP, and UDP traffic over a single persistent connection per client with no WebSocket or HTTP-over-HTTP dependency.
 - Architected a multi-tenant RBAC system with three isolated credential types (JWT sessions, PATs, tunnel secrets); identified and closed a domain-hijack security gap via transactional project revocation.
 - Automated Let's Encrypt certificate issuance and renewal via delegated DNS-01, enabling per-tenant custom domains without the platform ever storing third-party DNS credentials.
 - Shipped a full CI/CD pipeline (GitHub Actions) publishing Docker images to GHCR and cross-platform CLI binaries for Linux, macOS, and Windows on tagged releases; 176 tests passing, clippy-clean across the workspace.
-

RISMS — Multi-Tenant School Management SaaS

PHP 8.3 · Laravel · PostgreSQL · Vue 3 · Inertia.js · Docker · Traefik · Cloudflare · staging.risms.xyz

- Architected and built a multi-tenant SaaS platform from scratch supporting three tenant-resolution strategies (path prefix, wildcard subdomain, customer-owned custom domain) behind a single shared route and controller layer — no route duplication across access methods.
 - Designed a ledger-first financial subsystem: wallet balances computed from an append-only transaction log (never a mutable column), money as a first-class value object in minor units, and a pluggable per-institution payment provider architecture (encrypted per-tenant credentials, per-tenant webhook signature verification) supporting Paystack and cash without touching call-site code.
 - Built a memory-bounded three-pass streaming CSV/XLSX bulk import pipeline — distinct-values pass, user mapping pass, validated import pass — keeping memory flat regardless of file size with per-row transactional isolation so one bad row never aborts the batch.
 - Identified and fixed 6+ unbounded-query bugs across production pages (attendance, payment history, wallet ledger, admin dashboard) converting each to properly paginated, indexed queries with deterministic sort keys.
 - Enforced strict static analysis (PHPStan/Larastan) and a 780+ automated test suite as real merge gates, catching cross-tenant boundary leaks, nullable-type mismatches, and forged webhook signatures before deployment.
-

FLI — Rust CLI Framework (*Open Source*)

Rust · crates.io/crates/fli · github.com/codad5/fli

- Type-safe CLI library for Rust inspired by commander.js — **12,000+ downloads** on crates.io.
 - Supports hierarchical command structures, subcommands, flexible option types, and compile-time guarantees.
 - Auto-generates formatted help output with Cargo.toml metadata extraction.
-

PDFz — High-Performance PDF Extraction Service

Rust · Node.js · Docker · RabbitMQ · Redis

- Distributed PDF extraction service with support for both Tesseract and Ollama OCR engines.
 - Async queue-based processing via RabbitMQ for concurrent workload management; >85% uptime with retry mechanisms.
-

Resurgee — AI Task Orchestration Platform

Python · FastAPI · PostgreSQL · Redis · Celery · OpenAI GPT-4 · Docker

- AI layer on top of Google Tasks and Calendar: natural language task creation, smart rescheduling based on productivity patterns, bidirectional sync across multiple accounts.
- Unified OAuth flow handling user auth and multi-calendar linking in a single callback.

Education

B.Eng, Mechanical Engineering — University of Nigeria, Nsukka Graduated 2025
